

Security Barrier

Security Barriers are designed to form an effective physical obstacle. The barriers are made of coil clipped entanglements. It is possible to build different kinds of obstacle structures, depending on the desired degree of aggressiveness, using special steel clips. The barriers are three-dimensional and very difficult to pass, due to a unique system of connecting elements – clips, which firmly fasten entanglements and coils with each other. The most important feature of this barrier system is the ability to maintain its structure even if the system is cut in one or more points. The size of barriers is multiple of the sizes used for building coil clipped entanglements. Dimensions are adjusted to customers' needs, the only limitation being logistic and transportation capabilities. The barriers can be used with alarm systems or electric deterrent systems. The barriers can be assembled with hand tools or special pneumatic devices.
